

Help stop the spread of plant diseases on and off properties and parks

Phytophthora dieback kills native and exotic plants e.g. fruit trees. It spreads in moist soil and in plant material that can stick to horse's hooves, boots or bandages. To help stop its spread, stay on the trail and avoid riding on trails with soil that is wet and muddy. Having clean hooves before and after a ride helps stop the spread of dieback.

Make a hoof hygiene kit today!

1. Hoofpick with brush attached, or separate brush
2. Spray bottle of disinfectant, e.g. 70% methylated spirits in 30% water
